

PATIENTS AMONG US

Madelina required a blood transfusion at the age of two after experiencing a low count of red cells due to Hereditary Spherocytosis.

This is a rare disease that causes red blood cells to get trapped in narrow blood passages, which may lead to hemolytic anemia.

Thanks to the generosity of volunteer blood donors, today Madelina is active, healthy and happy because blood was there when she needed it.

**Consider
Yourself
Asked™**

Many people say they have never donated blood simply because they have never been asked. Please, Consider Yourself Asked. The difference you'll make in the life of a patient simply cannot be overstated.
